

User Proposes an Amendment

The user will click the "Propose Amendment" button from within the public chat area. The window will change to a propose amendment field. The user will type their amendment proposal. The user is also presented with a dropdown box to select the country that 'seconds' their amendment.

If the second user agrees:

The chair receives the request for an amendment. The chair will let the current speaker finish and then interrupt the speakers list with the proposed amendment. The delegates will vote to include the amendment.

If the vote passes:

The amendment is placed into the resolution. Debate begins on the amended resolution.

If the vote fails:

The amendment is thrown out and debate resumes on the unamended resolution.

If the second user disagrees:

The user receives the secondary's 'reason'. The user is returned to the original public debate interface where they will need to start again. The debate is uninterrupted and the chair never receives the request. This should help reduce amendment spam and encourage private discussion rather than blindly proposing amendments.
